Government feed — detection output report (vehicles & number plates, timestamped)

Platform: SENTINEL — Gujarat CCTV Hackathon 2026 prototype

Submitted by: Divij Patel, Meet Patel, Krish Patel — Team, Category 1 · vatsunp11@gmail.com

What was onboarded, and how

The full government sandbox grid (30 heterogeneous cameras, mixed H.264/H.265, mixed resolutions) was onboarded through the platform's catalogue sync: the backend fetched the gateway catalogue (`GET /api/ingest`) via `POST /api/cameras/sync` and registered every camera with its GIS coordinates, codec, and stream URLs. Live analysis consumed each feed over **RTSP forced over TCP** (`rtsp://103.250.160.189:8554/stream/<id>`), at most 4 concurrent captures (gateway pacing rule), with **all timestamps derived from stream PTS** anchored once per connection to the wall clock — never from arrival time or a declared frame rate. Detection pipeline: YOLOv8n vehicle detection → dedicated plate localization (open-image-models, `yolo-v9-t-384-license-plate-end2end`) → fast-plate-ocr plate reading, CPU-only.

Plate reads (registration numbers with timestamps)

All rows below are the backend's stored records (source of truth), not a side log — the report and the platform agree by construction.

#	Camera	Location	Plate (as read)	UTC timestamp (PTS-anchored)	Confidence
1	cam16	Visat P2, Chandkheda	`C30000`	2026-09-02T07:15:36.207Z	0.37
2	cam27	cam27 [sandbox]	`B33333`	2026-09-02T07:15:44.163Z	0.36

Vehicle detections without a legible plate (throttled sightings)

Plate-less vehicle sightings are PTS-throttled (max one per 3 s per camera) so busy junctions do not flood the store; each still carries a bbox and PTS-anchored timestamp.

Camera	Location	Vehicle-only detections	First (UTC)	Last (UTC)
cam01	Chiman bhai Bridge, Ahmedabad	48	2026-09-02T07:21:50.284Z	2026-09-02T07:24:56.158Z

Totals

- Detection rows stored (detector=`anpr`, this soak): **293**
- Number-plate reads: **27** (27 distinct plates)
- Vehicle-only sightings (throttled): **266**
- Cameras that produced detections: **11**
- Every plate read carries a snapshot (vehicle crop with the plate visible), bbox, PTS offset and a PTS-anchored UTC timestamp.

Where this data lives on the platform

The same records are queryable live at `GET /api/detections` (filters: `plate=`, `camera_id=`, `since=`, `until=`) and every route/plate query can be exported as a **hash-chained evidence dossier** (chain-of-custody PDF: per-sighting snapshots, SHA-256 hash chain, camera/GPS/timestamp table, operator identity, audit trail) — the platform's court-ready form of this report.
